TeXify Quick Guide

From installation to your first PDF

The TeXify team | October 11, 2026

Contents

1 Installation 1

2 Your first document 1
2.1 Pick a template . . . 1
2.2 Write the content . . . 1
2.3 Create the PDF . . . 1

3 Tips 2

1 Installation

TeXify is a Python package. Installing it takes less than a minute:

```
pip install -e ".[all]"
texify doctor
```

Without a local LaTeX engine TeXify builds through Docker automatically.

2 Your first document

2.1 Pick a template

`texify templates` lists every template. `texify new letter letter.md` creates a starting point from its example.

2.2 Write the content

The content is plain **Markdown**. Structured data such as addresses or invoice items goes into the header (*frontmatter*) between two `--` lines.

2.3 Create the PDF

```
texify build letter.md --open
```

3 Tips

You want …	Do this
A different colour	`accent: 2E7D32` in the frontmatter
A serif font	`font: serif`
German output	`lang: de`
Your sender data only once	`texify init` and `[defaults.sender]`
Your own design	`texify templates eject letter`
